Project Scope & Core Assumptions

PS : Design of app which can manage cab service for employees of any office.

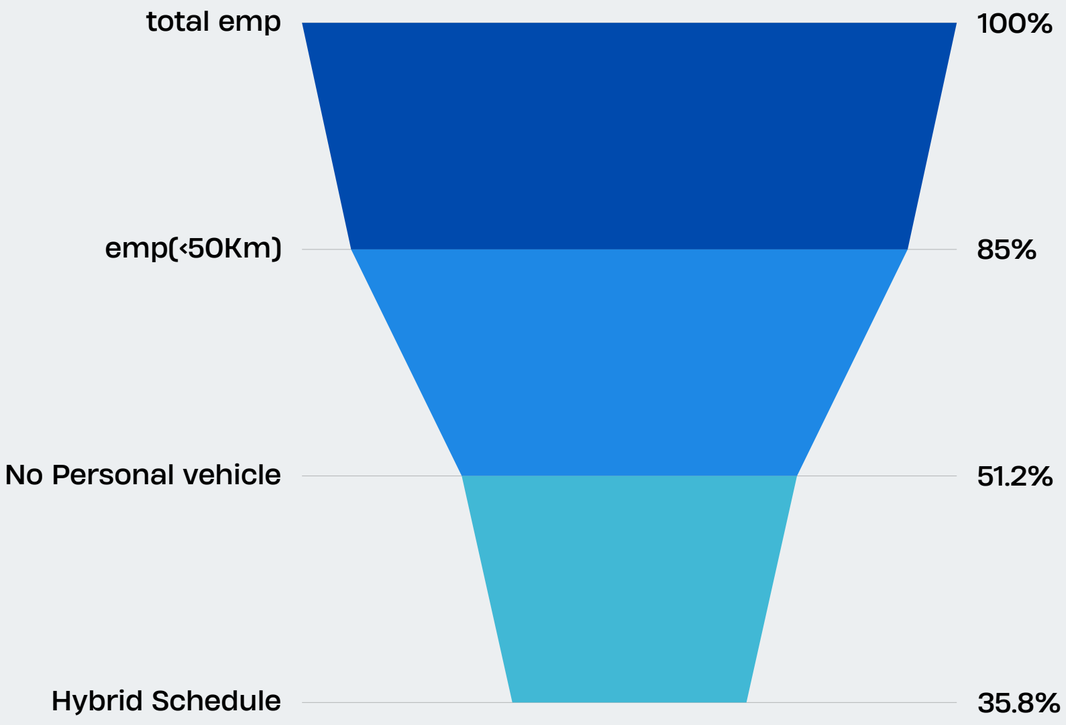
Comprehend the Situation

Company name : Mckinsey	Car Pooling : Allowed
Location : Gurgaon	Employee Count : 2ooo
Cab Payment : Company	Final Product : Application

Assumptions

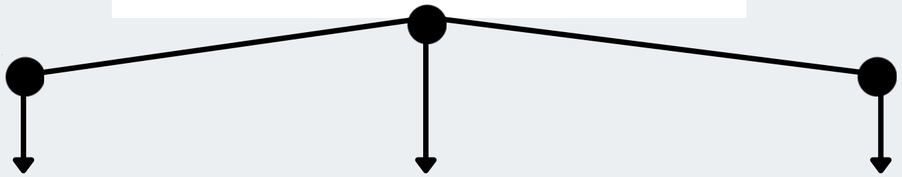
- App will be used only by company employees.
- Only those employee will used this service who are living within 50km diameter.
- 85% company employees live within 50Km radius.
- Employee will login by using McKinsey ID.
- All payment will be done by company.
- Office timing 9am to 5pm.
- Each Cab has capacity to accomodate 4 employees at once.

Market Sizing & Fleet Estimation



Total Employee to be consider for cab service will be around 700-750 for a single day

Segmentation



"9-to-5" Regulars (approx. 500 users)
Profile: HR, Finance, Admin, Engineering.

"Rotational" Shift (approx. 150 users)
Customer Support, IT Ops (24/7 support)

"Ad-Hoc" Executives (approx. 65 users)
Profile: Sales, Consultants, Senior Management.

Fleet Estimation

- Peak Demand: 500 employees need to arrive by 9:00 AM.
- Vehicle Capacity: Average 4 pax per cab (sedan).
- Equation: 500 employees / 4 per car = 125 Trips.
- Optimization: If the average trip is 1 hour, a single cab can potentially do two pick-up loops (e.g., one at 7:30 AM, one at 8:45 AM).
- Final Fleet Size: You likely need ~70-80 Cabs to manage this office efficiently.

Uncovering the Core Pain Points

Employees

- Uncertain cab confirmation & availability
- No real-time ride visibility
- Safety concerns during off-hours travel
- Privacy issues when contacting drivers
- Commute delays affecting work schedules
- Difficulty managing multi-stop work trips.

Admin

- Manual cab rostering and scheduling
- Limited real-time fleet visibility
- Delayed awareness of ride issues
- Complex billing and reconciliation
- Difficulty enforcing vendor compliance

Driver

- Unclear pickup sequences and routes
- Last-minute changes causing confusion
- No visibility into passenger verification
- Difficulty coordinating with multiple passengers
- Delays impacting next assignments

Prioritizing Core Pain Points: A Severity-Based Approach

RICE ANALYSIS

Feature	Reach	Impact	Confidence	Effort	RICE Score
Employee Login (McKinsey ID)	High	Very High	High	Very Low	**Very High**
Pre approved Booking	High	Very High	High	Low	**Very High**
Live Tracking	High	Very High	High	Low	**Very High**
Passenger Verification	High	Very High	High	Low	**Very High**
SOS for Safety	High	High	High	Low-Med	**HIgh**

RICE Score = (Reach × Impact × Confidence) ÷ Effort

R – % users impacted
I – Value per user
C – Confidence on feature
E – Dev + Ops effort

Feature	Reach	Impact	Confidence	Effort	RICE Score
Number Masking	High	Medium-High	High	Low	**High**
Autopay to Vendors	High	High	High	Low-Med	**High**
Auto Delay Reporting	Med-High	High	Medium	Medium	**Med-High**
Ride Feedback	Medium	Medium	Medium	Low	**Medium**

Feature	Reach	Impact	Confidence	Effort	RICE Score
Multi-stop Trips	Medium	Medium	Medium	Medium	**Medium**
Carbon Footprint Tracking	Low	Low	Med-Low	Medium	**Low**
AI-based Route Optimization	Low	Medium	Low	High	**Low**

Feature Prioritization Roadmap

Mo Must Have	S Should Have	Co Could have	W Won’t Have
• Employees Login via McKinsey ID • Automated Rostering • Pre-approved cab booking • Live Tracking • SOS for Safety • Navigation & Sequencing • Passenger Verification	• Number Masking (Call without revealing phone) • Report Delays Automatically • Autopay System to Vendors • Ride Feedback	• Multi-stop trips • Carbon Footprint Tracking • AI-based Route Optimization	• Preferred Drivers

- Build the Engine First: Login -> Rostering -> Navigation.
- Add Safety: SOS -> Tracking -> Verification.
- Add Finance: Auto-billing.
- Add "Delighters" Last: Carbon tracking, Multi-stops.

Operational Model Evaluation

Parameters	Own Fleet	Local Vendor	Ola/Uber for Business
Capital Cost	Very High	Zero	Zero
Per-Trip Cost	Low (Fuel + Driver Salary)	Medium (Fixed Monthly Rate + Mileage)	**High/Variable** (Dynamic Pricing + Commission)
Reliability	**Highest** (100% Dedicated)	**High** (Contractually Bound)	**Low/Unpredictable** (Drivers can cancel)
Safety/Trust	High (Vetted permanent staff)	High (Verified regular drivers)	Variable (Random driver every day)
Admin Headache	**Severe** (Maintenance, Insurance, Hiring)	**Moderate** (Managing the Vendor)	**Low** (Automated Dashboard)

The Final Verdict :

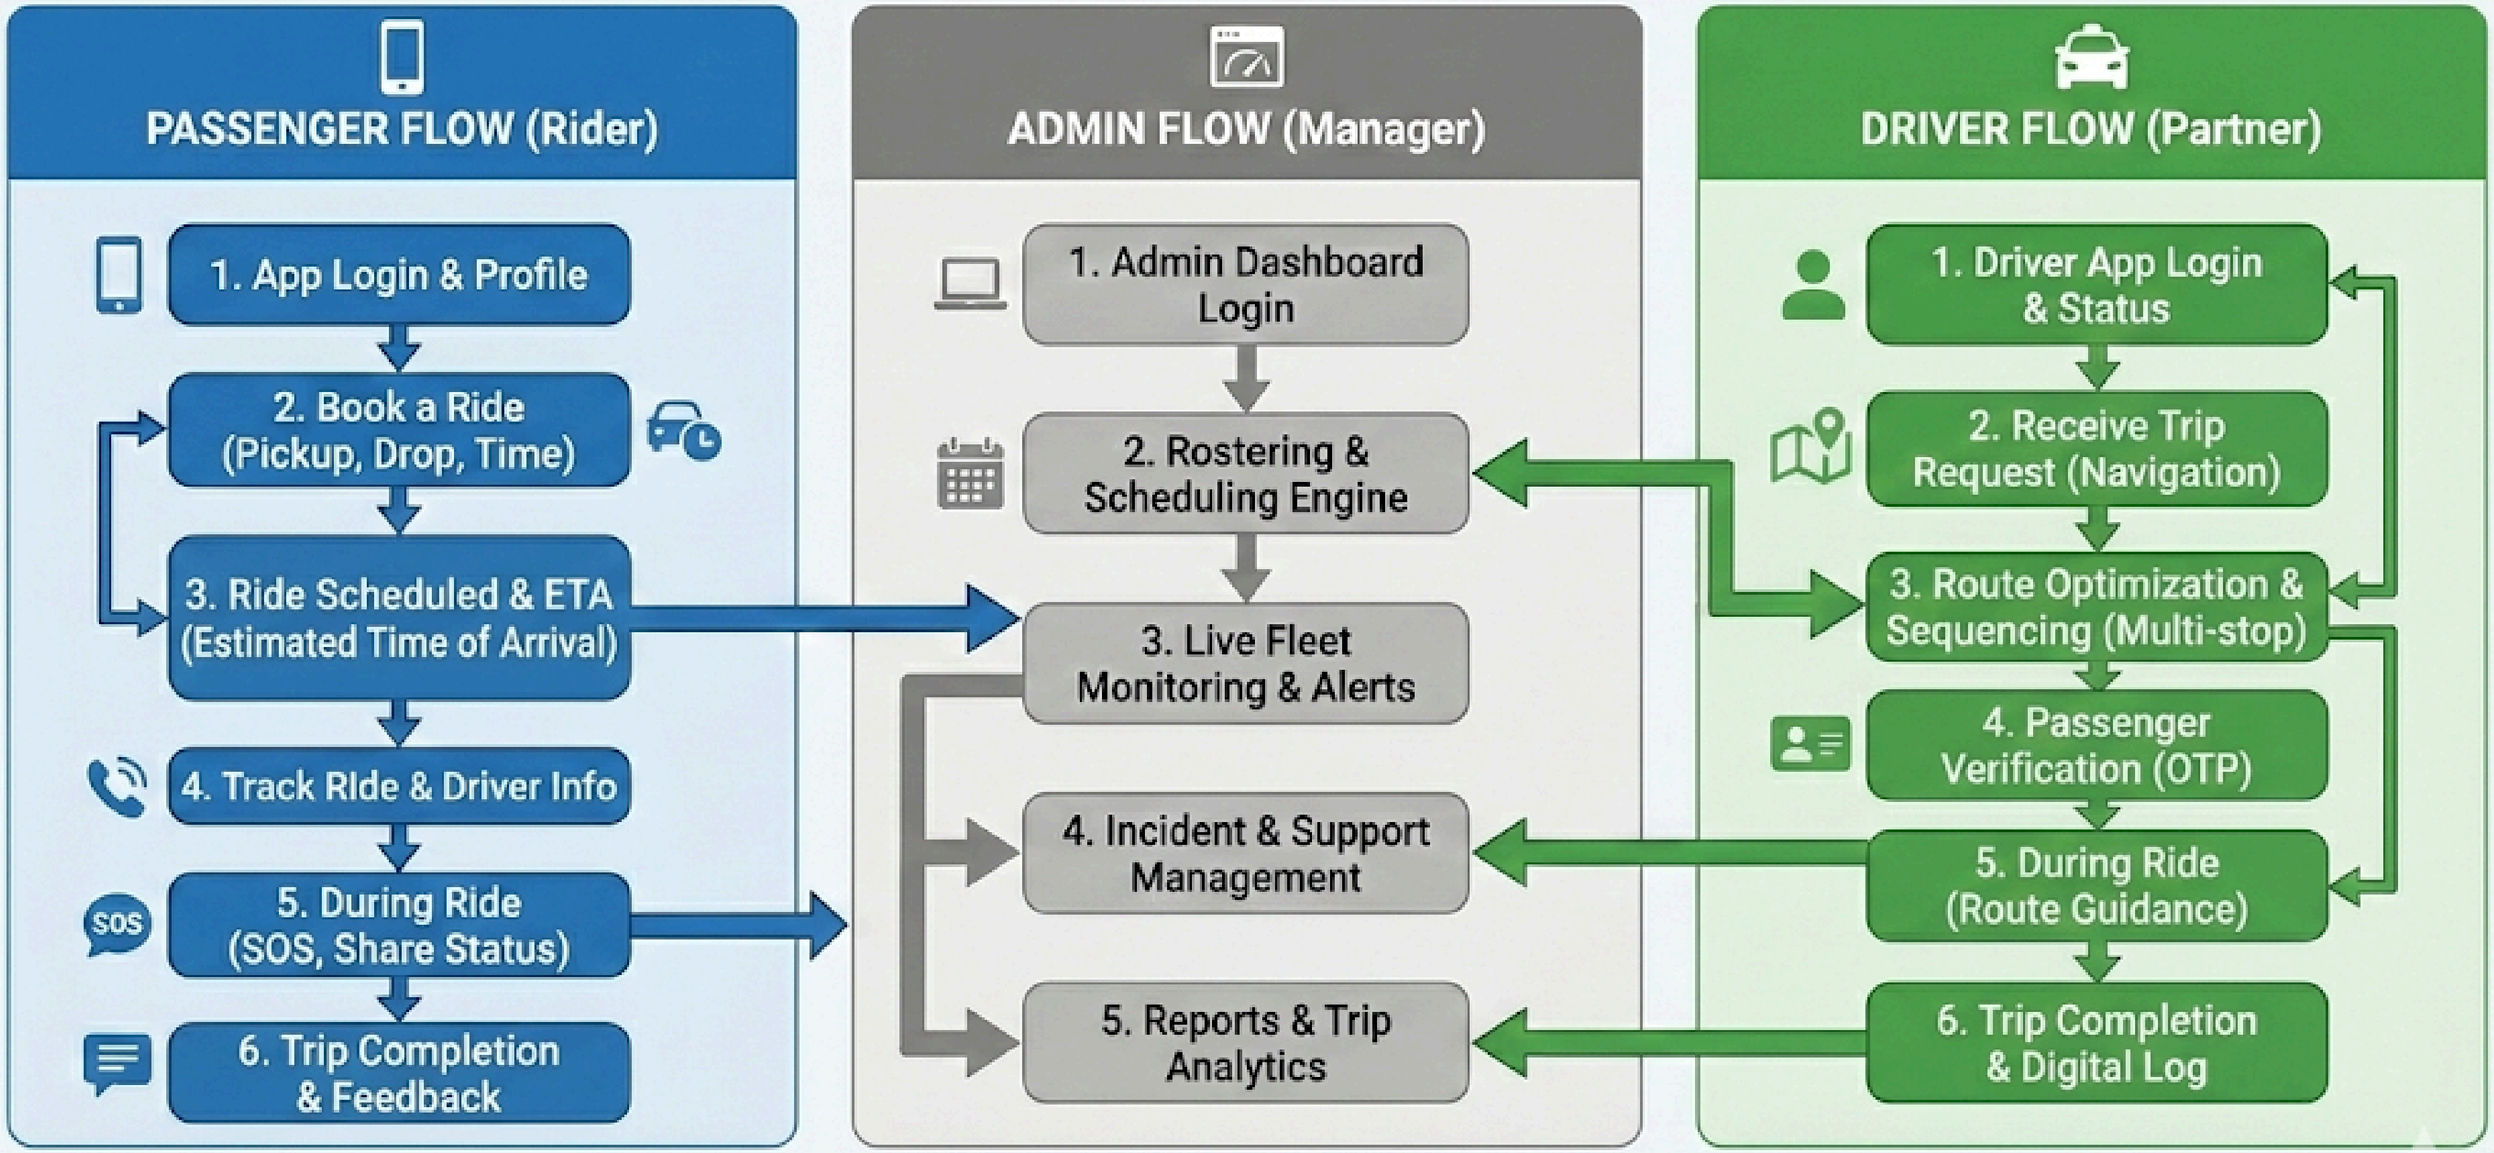
For a 2,000-employee office with 500 daily peak commuters, Option B (Local Vendor) is the clear winner for the core operation.

Why?

Reliability: You cannot risk 50 employees being stranded at 9 AM because Uber drivers cancelled. A Local Vendor contractually guarantees the fleet.

Cost: For predictable, high-volume routes (the "Line Haul"), a fixed vendor contract is 20-30% cheaper than Uber's daily rates.

Cab Service App: End-to-End User Flow (Passenger, Admin, Driver)



Seamless Integration & Real-Time Communication
